

CENTOS 7

UPGRADE TO PHP 7.4

Install the EPEL repository configuration package:

```
sudo yum install https://dl.fedoraproject.org/pub/epel/epel-release-latest-7.noarch.rpm
```

Install the Remi repository configuration package:

```
sudo yum install https://rpms.remirepo.net/enterprise/remi-release-7.rpm
```

Install the yum-utils package (for the yum-config-manager command):

```
sudo yum install yum-utils
```

Enable the repository:

```
sudo yum-config-manager --disable 'remi-php*'
sudo yum-config-manager --enable remi-php74
```

Upgrade (the repository only provides PHP):

```
sudo yum update
```

Install additional packages:

```
sudo yum install php-{fpm,gd,json,mbstring,mysqlnd,xml,xmlrpc,opcache,cli,zip,soap,intl,bcmath,curl,ssh2}
```
